ONE-PAGE REPO SUMMARY

AI Blog

Workspace Evidence
Repo snapshot reviewed on 2026-03-26
Output target: posts/

WHAT IT IS

Local-first MDX publishing app built with Next.js 16, React 19, and Ollama. It generates posts into local files and serves them through a public blog plus protected admin and pipeline views, without a paid AI API in the generation path.

WHO IT'S FOR

Primary user: a local-first publisher, solo creator, or small team that wants to generate, review, and ship blog content from its own machine, then optionally push the resulting MDX to GitHub or a hosted Next.js site.

WHAT IT DOES

- Generates new MDX posts locally from scripts/generate-post.ts, with --count, --topic, and --dry-run support.
- Uses local Ollama generation and falls back to built-in markdown templates if Ollama is unavailable.
- Renders a public homepage, article index, and dynamic article pages from local MDX content.
- Enriches posts with frontmatter, read time, related reading links, tags, and affiliate or recommended-tool sections.
- Provides a protected content manager with article list, preview mode, and raw MDX view.
- Provides a protected pipeline dashboard showing output folder, recent runs, topic usage, and GitHub publish status.
- Supports email capture via Mailchimp or local placeholder storage, plus optional AdSense slots and sitemap generation.

HOW IT WORKS

- data/topic-clusters.json and data/products.json guide topic rotation and review-style matches; scripts/generate-post.ts calls local Ollama at http://localhost:11434/api/generate, writes MDX to posts/, and logs runs to .tmp-generated/.
- lib/posts.ts reads posts/ and legacy app/blog/posts/, parses frontmatter with gray-matter, derives descriptions, tags, and read time, then injects related links and affiliate monetization from data/affiliate-links.json.
- app/page.tsx, app/blog/page.tsx, and app/blog/[slug]/page.tsx render the public site; article pages use MDXRemote and per-page metadata.
- app/api/admin/posts/route.ts feeds app/admin/page.tsx; lib/middleware.ts and app/api/auth/login/route.ts gate /admin and /pipeline with ADMIN_SECRET.
- lib/content-engine.ts reads generation logs for app/pipeline/page.tsx; app/actions/email-capture.ts stores signups locally or posts them to Mailchimp; app/sitemap.ts builds sitemap entries.

HOW TO RUN

1. npm install
2. Create .env.local with NEXT_PUBLIC_SITE_URL=http://localhost:3000 and ADMIN_SECRET=change-this.
3. Start Ollama. Repo docs show ollama pull llama3 then ollama serve.
4. Generate content with npm run generate.
5. Run npm run dev and open http://localhost:3000.

Repo note: docs say pull llama3; the generator script requests llama3.1:8b. The current generation path does not show a remote database or paid AI API requirement.

Evidence sampled from README.md, architecture.md, SETUP_STEP_BY_STEP.md, scripts/generate-post.ts, lib/posts.ts, lib/content-engine.ts, app/page.tsx, app/blog/[slug]/page.tsx, app/admin/page.tsx, app/pipeline/page.tsx, app/actions/email-capture.ts, and related route/data files.
